

Project Documentation

Performance Load Testing using Python

Objective

Develop a basic Python application to perform performance load testing by sending multiple HTTP GET requests to a target website and measuring response times.

Project Scope

This project demonstrates basic web performance testing concepts. It records HTTP status codes, response times, and calculates the average response time.

Tools & Technologies

Python 3.x, Requests library, Git, GitHub, VS Code.

Project Structure

sourcecode/load_test.py
README.md
requirements.txt
output/results.txt
screenshots/
documentation/

Working Principle

1. Set target URL.
2. Send multiple GET requests.
3. Measure response time.
4. Display results.
5. Save summary to results.txt.

Expected Output

Displays request number, HTTP status code, response time, and an average response time summary.

Future Enhancements

Add concurrent users, graphs, CSV reports, command-line arguments, and HTML reports.

Conclusion

The project provides a simple introduction to performance load testing using Python and can be extended for more advanced testing scenarios.
